

Nick Funk

Vice President of Engineering

Over his 15 years in engineering, Nick has experienced what it takes to be successful at all stages of the software development lifecycle. While at Raytheon, Nick worked on defense aviation projects through design, development, integration and flight test, and operational support. This experience taught him the value of building the right solution for a problem, as well as the important role that engineering plays when the stakes are high.

As Vice President of Engineering, Nick applies all those skills simultaneously, as he is charged with overall responsibility for SDVI software development including design, implementation, validation, and deployment of all SDVI product lines. As such, he is dedicated to building a diverse engineering team while maintaining a healthy and sustainable engineering culture. Most importantly, however, Nick is focused on supporting his team in building a platform they can be proud of.
